Smooth flow Pump

Direct-driven type

Hydraulic type

Plunger type

Metered supply

A New Paradigm to Create Safe and Reliable

Diaphragm metering pumps are known for their outstanding performances, as they precisely meter and transfer any kind of liquids without excessive pressure or shear. Yet, with this method of transfer, there is still the problem of "pulsation," and so diaphragm metering pumps have been regarded as difficult to implement in manufacturing processes that require high precision.

The TACMINA Smoothflow Series, the highly innovative pulseless diaphragm metering pump, addresses this problem without sacrificing performance.

As an ideal answer for liquid transfer, the Smoothflow Pump can be configured in-line in processes, and operated automatically and continuously. It also ensures greatly enhanced operator ease, product quality and productivity. What's more, your burden of capital investment and maintenance can now be considerably reduced, providing you with "safety" and "reliability."

Transfer of Liquids

For Those Who Want Total Control in Liquid Flow

Smoothflow — the ideal method of liquid transfer. This innovative method not only meets your liquid transfer needs, but provides optimal solutions to Man, liquids and the environment as well.

TACMINA's Smoothflow technology, based on unique know-how cultivated over 50 years, delivers you ultimate performance and provides complete satisfaction.

Ideal for the metered transfer of difficult-to-transfer chemical liquids and fluids, such as high-temperature, high-viscosity resins and inflammable chemicals.

Direct-driven type Page 7 Ideal for the high-pressure and metered injection of highly volatile chemicals, such as emulsions, latex and slurry.

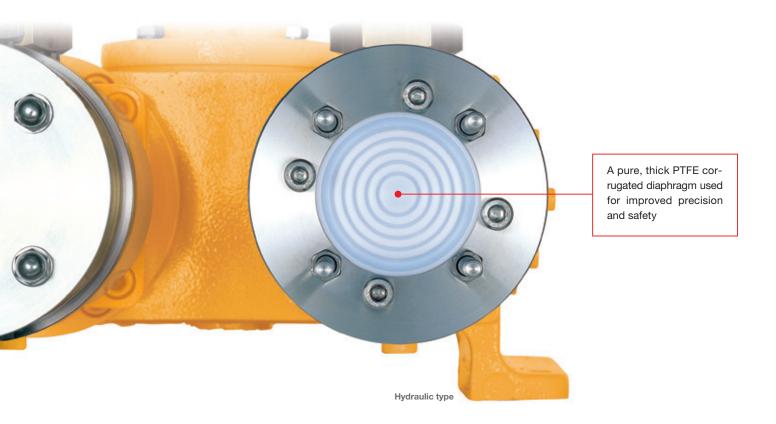

Hydraulic type ····· Page 9

Ideal for high-accuracy, high-pressure injection

Plunger type ····· Page 11

 $\boldsymbol{\ast}$ On some products, the base is not provided in the standard specification.

An Ideal Pump Mechanism for Accurately and Gently Transferring Liquids

No Entry of Foreign Matter*

Since the pump has no rotating or sliding parts, where foreign matter is often generated, the risk of foreign matter contamination is greatly reduced. This pump can be used safely for processes that require the strict quality management, such as the food industry, pharmaceutical industry, electrical machinery industry, and so on.

No Leakage*

The Smoothflow pump has no seals, which frees you from the worry of leakage. This is ideal for the transfer of toxic substances that are hazardous when leaked outside or for liquids that easily vaporize.

No Damage to Liquid*

The Smoothflow pump does not stir or compress liquids like other pumps. This enables the transfer of food or chemicals whose propaerties are not allowed to deform due to shearing, abrasion, pressure or changes in temperature.

Accurate Transfer of Even Small Amounts

As a backflow prevention mechanism is included in the pump body, the flow rate will not be lowered even when the pressure fluctuates. This is suitable for applications that require high-precision supply capabilities such as coating and mixing drugs. It is also suitable for applications that require accurate mixing ratio/accurate measurements.

Idling Possible*

The Smoothflow pump is designed in a seal-less structure, which does not adversely affect the drive unit even during pump idling. This frees you from the worry of possible malfunction.

Fluid transfer structure that is optimal for transferring slurries*

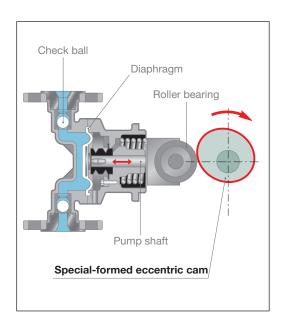

As the diaphragm pump gently pushes out the fluid, the wetted parts do not suffer from abrasion by slurries such as diatomaceous earth slurry.

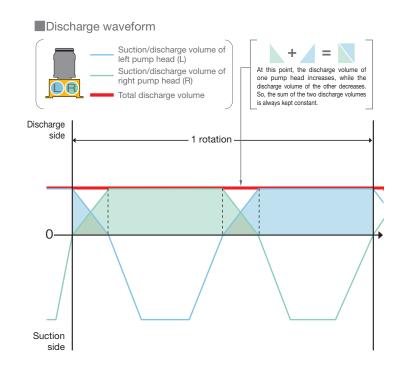

"Special-formed Eccentric Cam" Ensures Pulseless Continuous Discharge

On conventional duplex metering pumps, pulsation occurs on the discharge side as rotary motion of the circular eccentric cam is converted to reciprocating motion.

However, by applying the special-formed eccentric cam to set the sum of the discharge volumes of both the left and right pump heads to a constant value, TACMINA has achieved smooth, pulse-free continuous metered operation on a diaphragm pump.

Smoothflow pump (Example: Direct-driven type)

Enables process in-lining*

The Smoothflow Pump instantly solves pressing issues in manufacturing processes – efficiency (time), improved yield (product) and labor savings (personnel). It also eliminates liquid contact with the outside air and uneven injection, thus improving product quality.

No Need for Dampers or Accumulators

Generally used accumulators are slow to react and must be monitored and serviced at all times. TACMINA Smoothflow pumps offer quick reaction, and free you from the need for unnecessary maintenance and troublesome pressure adjustments.

Easy Piping, and Enhanced Cost and Space Savings

Extremely economical because of little transferring liquid loss as piping on the discharge side can be made thinner than piping on pumps that generate pulsation

Easy Maintenance

Accumulators or cushion tanks for even injection are no longer required. The Smoothflow Pump has few liquid end materials, which overall simplifies disassembly, cleaning and maintenance.

Eliminating the Major Cause of Pump Trouble

The Smoothflow Pump has done away with the in-tank agitation mixing process, the major cause of various pump trouble. This minimizes the incidence of accidents and malfunction.

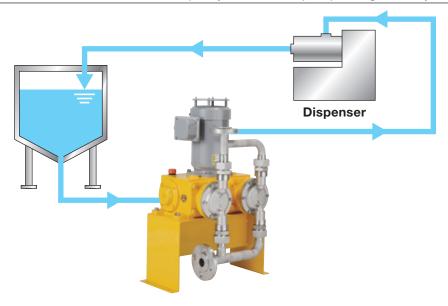

Excellent responsiveness

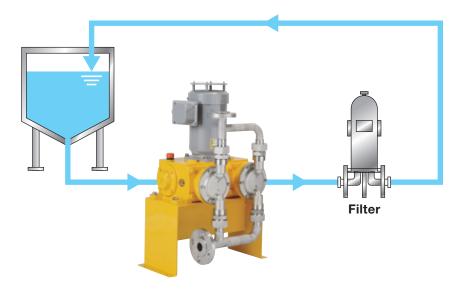

In addition to the non-pulsation property, Smoothflow pumps offer instant response to flow rate change.

Unlike the non-pulsation achieved by a conventional air chamber, a Smoothflow pump discharges immediately after starting the operation and no liquid drips when the operation is stopped, allowing for precise adjustment of supply amount and mixing ration.

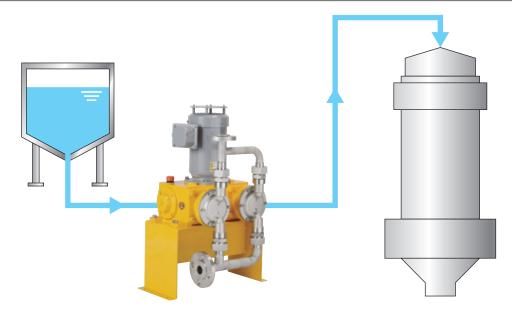

Dispersion process: Contributes to stable quality without the pump being worn by slurry liquids.

Filtration process: Prevents flow rate decreases due to filter clogging.

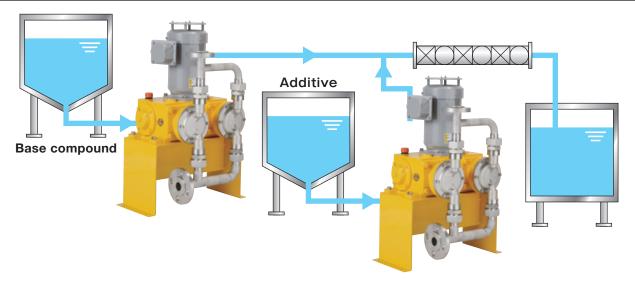

Spray-drying process: Contributes to homogenizing particle size by a constant flow with no pulsations.

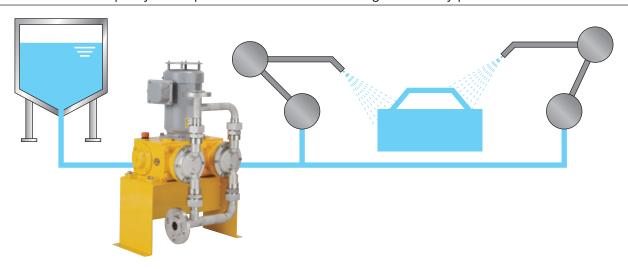

In-line continuous preparation process:

Creating an in-line process realizes uniform preparation with high accuracy without foreign particle contamination.

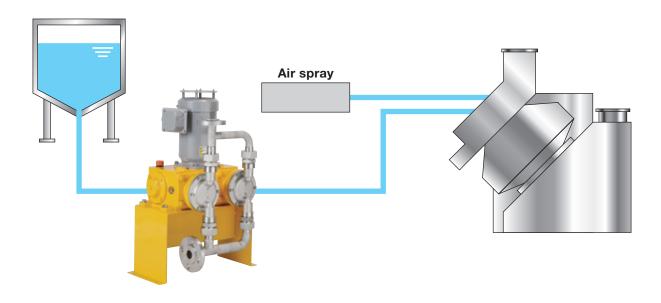

Paint spraying process :

Realizes increased quality of the painted surface without being affected by pressure fluctuations.

Coating process: Contributes to increased quality of the coated surface with a constantly stable continuous flow.

Direct-driven Type

D (Direct-driven diaphragm) type

- Low-cost but capable of highprecision injection
- Excellent durability. Ideal for exacting applications in processes
- Simple mechanism facilitates parts replacement and maintenance.

* The picture shows the PTFE type.

- Dilution of sulfuric acid and caustic soda
- Circulation of paint in dip tanks
- Injection of curing agents for molding sand
- Glaze spraying process

^{*1} SCS14 casting has the same composition as SUS316. *2 Model 3P and 6 use SCS14. *3 Models 3P and 6 use PFA/silicon rubber. *4 Model 03 uses special fluororubber (perfluororuber). Models 3P and 6 use a combination of PTFE/FEP and silicon rubber.

W (Direct-driven double diaphragm) type

- Highly corrosion-resistant pure, thick PTFE is used for the front diaphragm.
- The buffer solution filled between the two diaphragms alleviates diaphragms' fatigue.
- A leak monitor or remote head can be mounted for safer transfer of liquids.

Application examples

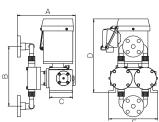

- Injection of filter media in beer filtration
- Transfer/injection of organic solvents
- Transfer of highly corrosive solvents
- Injection of chemicals in leather production

- 1 Loose flange
- 2 Joint
- 3 Check ball
- 4 Valve seat

^{*1} Pumps with 3 or more heads can also be manufactured. Contact TACMINA for details. *2 For Model 01, Type is D and Liquid end material is VECE, VTCF, or STST. For Model 08, Type is D and Liquid end material is VECE. *3 If the model uses VECE, then Type is D. *4 If the connection type is Union, Liquid end material is STST. *5 For further information contact TACMINA.

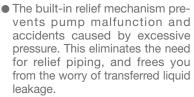

Hydraulic Type

M (Hydraulic diaphragm) type

Features

 Pure, thick and extremely highly corrosion-resistant PTFE used for the front diaphragm.

- Transfer of adhesives for sticky sheets
- Precipitation process for organic metal powders
- Injection of urea solution for denitration and desulfurization
- Injection of catalysts for the production of plastics ... etc.

MW (Hydraulic double-diaphragm) type

Features

- Slurry and high-viscosity liquids can be discharged and transferred at high pressure.
- The buffer solution unifies the pressure generated in the drive unit and transfers the pressure to the diaphragm without damaging it.
- Use of two diaphragms frees you from the worry of entry by hydraulic operating oil.
- A leak monitor or remote head can be mounted for safer transfer of liquids.

Application examples

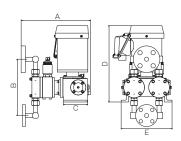

- Mixing of plastics having dual liquid properties
- Drink preparation process
- Metered transfer of high-concentration zirconia (slurry)
- Metered injection of flavorings, colorings, aromatizing liquids ... etc.

- 1 Joint
- 2 Check ball
- 3 Valve seat
- 4 O-ring
- ⑤ Pump head
- ⑥ Hydraulic pressure regulator In the case of a piping blockage, the built-in relief mechanism releases the excessive pressure to improve safety and durability.
- 7 Pump shaft
- ® Operating oil For sustained performance and safety, lowtoxic, stable silicon-based oil is used in addition to the gear oil for the drive unit.
- Front diaphragm
 Pure, thick PTFE corrugated diaphragm used
- 10 Rear diaphragm
 Pure, thick PTFE corrugated diaphragm used
- 1 Buffer solution

^{*1} Pumps with 3 or more heads can also be manufactured. Contact TACMINA for details.

An Extensive Line-up of Pulseless Pumps to Suit Operating Conditions and Applications

TACMINA presents you with a wide line-up of products to match your particular requirements for different liquid types such as high-viscosity, liquids containing slurry or high-temperature liquids, or for improved precision injection or higher safety applications.

For supplying electrode materials

Maximum discharge volume

ranging from 0.14 to 2.5

L/min Maximum discharge

Ideal for the precise supply

of coating liquids and elec-

pressure of 0.5 MPa.

trode materials.

For supplying coating liquid

- Maximum discharge volume ranging from 0.1 to 10.5 L/min Maximum discharge pressure of 0.5 MPa.
- Ideal for applications requiring high levels of precision such as precision thin-film coating using die coaters.

- Seal-less, sanitary liquidend structure.
- Capable of gentle, metered transfer of liquids without any change to liquid properties.

•Injection and transfer of chemical liquids at a maximum of 80 L/min.

Simple constructure to as-

sure reliable cost effective-

High-viscosity Specification

- ■Capable of transfer up to a maximum viscosity of 300,000 mPa·s
- Liquid can also be extracted from vacuum tanks.

Large-capacity type Small-capacity type

- Ideal for laboratories and high-mix low-volume processes.
- Precise chemical transfer with trace amounts.

Triplex Type

- Capable of transferring liquids in a pulseless state on not only the discharge side but also the suction side.
- Capable of large-volume discharge.

Slurry Liquid Specification (T-branch remote head)

- A T-branch system prevents direct contact between the diaphragm and settling slurry.
- Simultaneously solves the problems of diaphragm service life and slurry blockage.
- * Pulseless type becomes duplex specification.

High-temperature Liquid Specification (Remote head) Heat is not transmitted to the

- Pheat is not transmitted to the pump itself, which allows the transfer of high-temperature liquids exceeding 100°C.
- Heat-radiation fin or heat-insulating jacket can be installed

For details of application products, refer to the respective catalogs.

More Safely, More Accurately and More Simply. Highly Functional Optional and Related Products

We have more optional products available to match specific site requirements and answer your diverse needs.

【Valve】

Relief Valve

Automatically releases the excessive pressure when foreign matter blocks the discharge side piping of the pump or the valve is closed at the discharge side.

Leak Monitor

The electrode installed in the buffer solution immediately detects diaphragm breakage, and notifies the operator.

Back Pressure Valve

Prevents overfeeding (exceeding the preset discharge volume) that is caused on bad piping conditions.

[Motor]

AC Servo Motor

This motor can be controlled in small increments over a wide operating range extending from the low-through high-speed areas. Brushes are not used, which eliminates the need for maintenance.

Exclusive controller

[Sensor]

Pulse Sensor

Uses a reed switch to detect the pump's operating speed as a pulse signal.

Interlocking with a pulse counter enables the configuration of an automatic metering feed injection system.

[Controller]

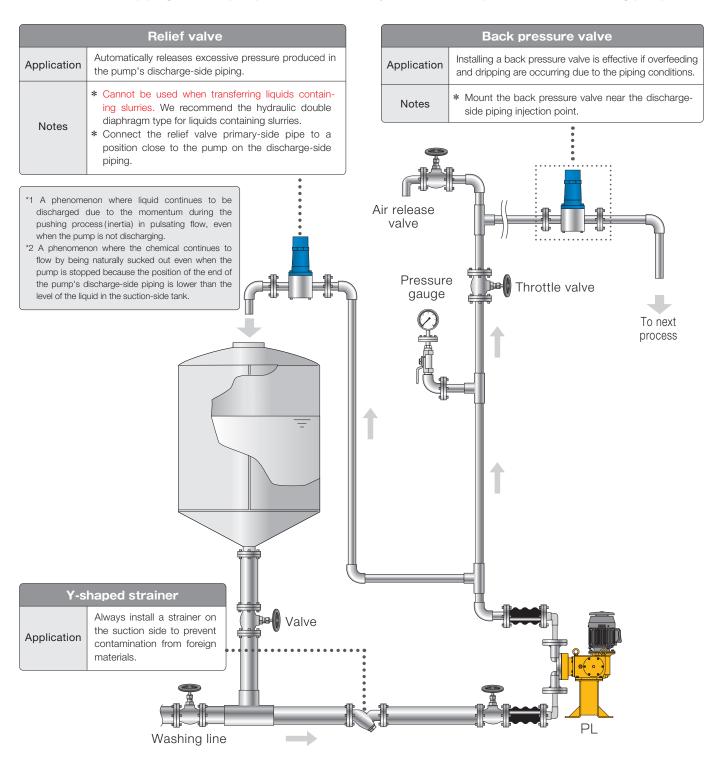

Inverter(Frequency control method)

This controller can control the speed of all models of motors at low cost. Also, a wide control range of 10:1 is possible without any influence from the power supply used.

For more details on our products, please visit TACMINA's home page.

In order to fully demonstrate the capabilities of metering pumps (metering performance, discharge accuracy), the correct piping design and auxiliary equipment must be installed. Appropriate piping design also helps to prevent piping and pump accidents and problems, and promises safety and peace of mind for production lines. The recommended piping for each pump mechanism will fully draw out the capabilities of the metering pump.

Introducing Smoothflow diaphragm pumps with no pulsation.

Point 1

Install an air release pipe on the suction side if necessary. (Example:Liquids that easily vaporize or that produce gas such as sodium hypochlorite).

Point 2

If the length of the piping becomes long, the pipe resistance will increase and abnormal pressure will be generated, which may damage the diaphragm or eccentric shaft

Point 3

Always install a relief valve on the discharge-side piping. This prevents abnormal pressure from damaging the pump.

Point 4

In order to prevent piping accidents, select a pipe size for the piping in the discharge and suction areas, as well as the relief valve and back pressure valve, that is equal to or larger than the pump diameter.

Point 5

Design the process so that the pump suction-side piping is short and simple.

^{*} The above diagram is one example of piping. For more details, contact your sales representative.

^{*} The hydraulic double diaphragm type is suited to high-accuracy transfer and injection of liquids containing slurries and highly viscous fluids. For detailed piping designs, please contact us.

^{*} Install valves before and after each device for maintenance and inspection purposes.
